

Portfolio Fixes Production ULTIMATE

Have some minor changes. Increase the Size of the Text Under the Loader Cube . Dont Say Getting the Globe Ready , say something creative , we wont give a spoiler that there is a Globe beforehand itself.

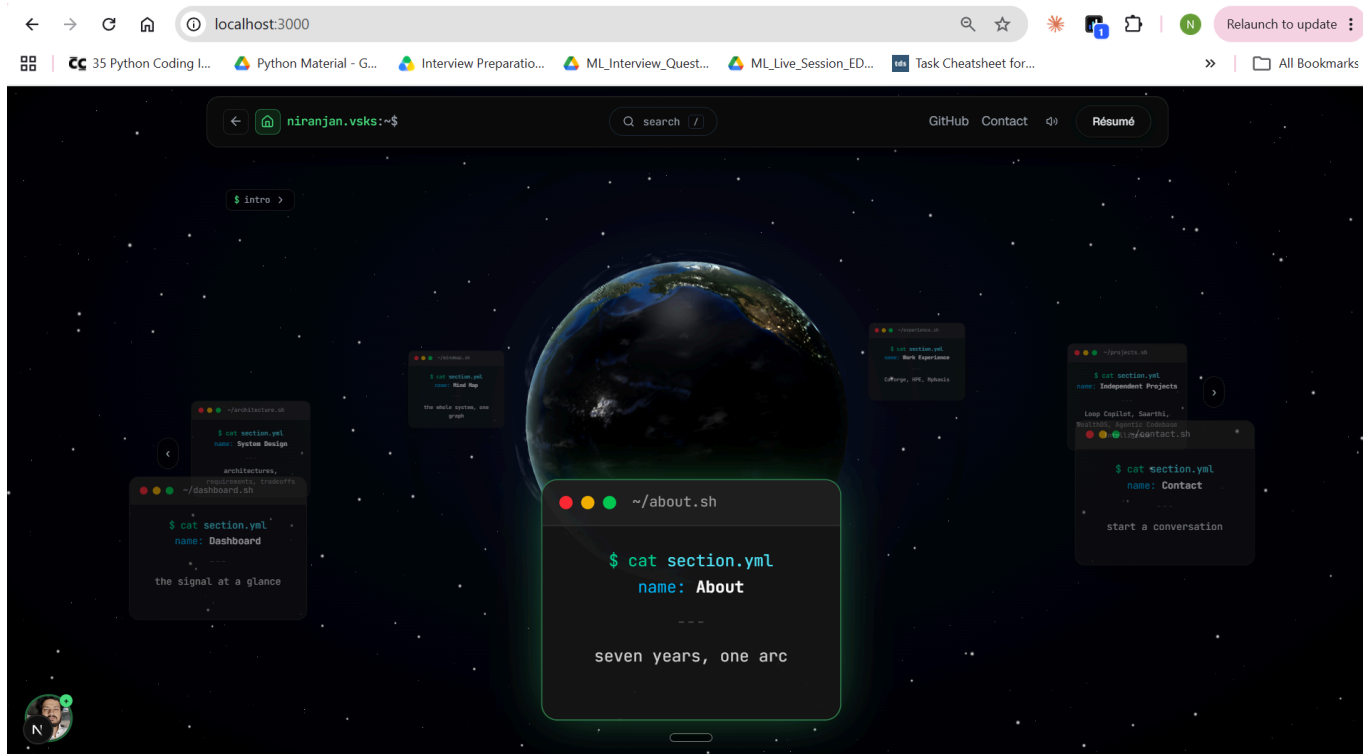

Also coming to the Landing page :
This is 100% View .

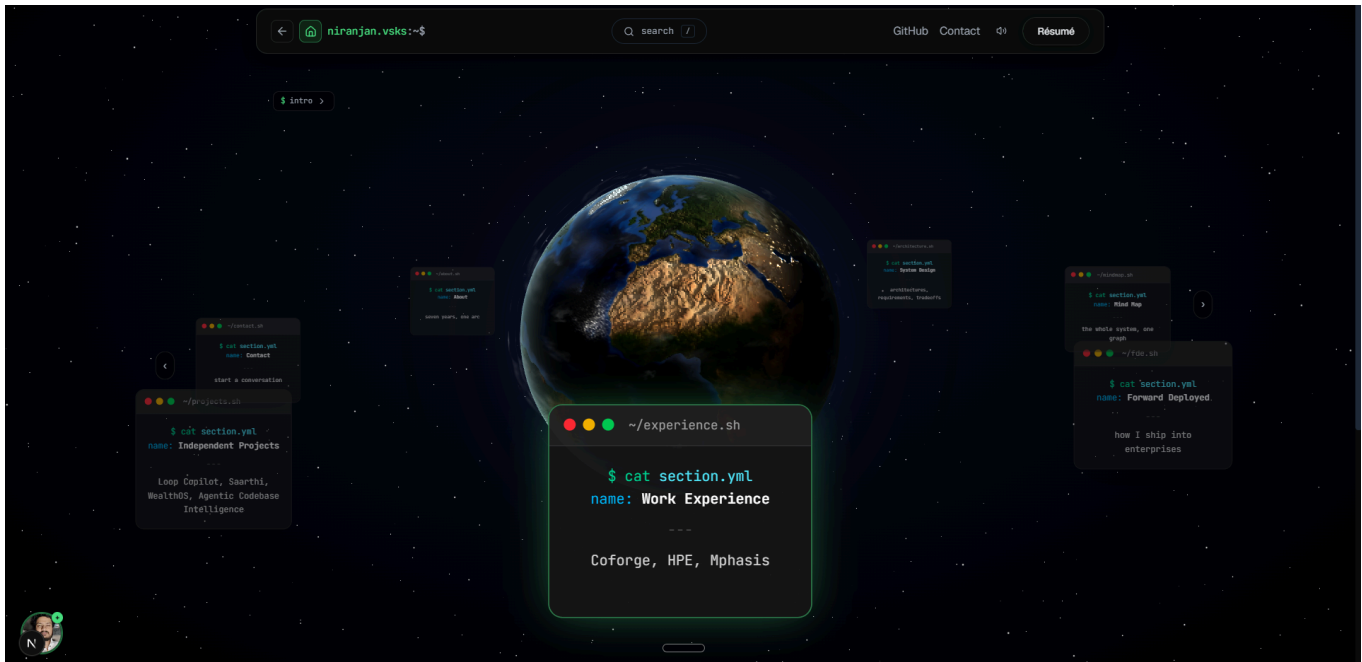

If you notice the problem where I said the cards are coming too big, so big that it is blocking the globe itself, that thing is actually happening because in a 100% view (that is, in the screen size 100%, the actual normal view) this thing is not looking the best. Only the landing page, I say, but now I am sharing with you a screenshot of it in 67%, and 80%.

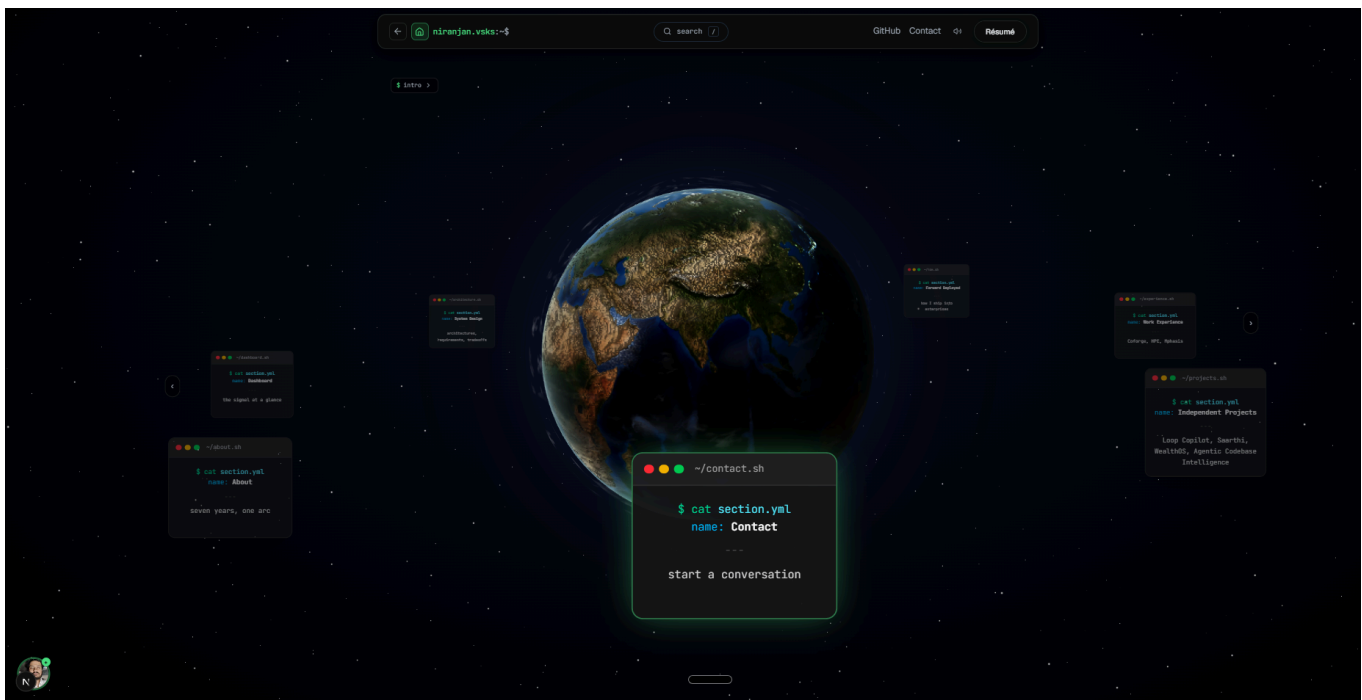

75%

67%:

50%:

Notice here as the Screen size kept getting smaller , it started looking more clean and more polished and symmetrical . Cleanest and symmetrical was 75% view for me coming to the landing page . With Avatar , and intro Heading Text Expanded , This one is looking most clean . So What I want you to do is For the Landing page , I want you to adjust the screen to the 100% View as per 75% view . Each and every element must be adjusted according to that and that size. only the Centre Focused Card maybe can be zoomed tad bit little maybe(ever so slightly , very subtle) So For the Remaining Screens , Make No changes . Another Change in The terminal Cards is - This is important , So the Clicking action is either not properly Enabled or integrated , or it only works on Double click or centre click . Or there is a

massive glitch. So what is happening right now is that. When I'm clicking, when one card comes to the center focus and then I try clicking on it, I click anywhere in that card, maybe on the top bar of it or maybe the center or maybe on the name. The click doesn't apply. Sometimes the click applies, sometimes the click doesn't apply. When it doesn't apply it still keeps rotating and the user doesn't get to know if it is being clicked or not. There's no loader being shown and randomly after a while it redirects to that section.

Because it's keeping revolving, let's say the contact section was the one in focus and the user clicked on the contact section. Because it is revolving the mindmap section has come into focus now and the user made another click on the mindmap. Now the contact section is being loaded because that is the first click that has been made and the mindmap click was not recorded. Since there was no loader shown, the user is not able to understand what's happening and that is a very glitchy UX.

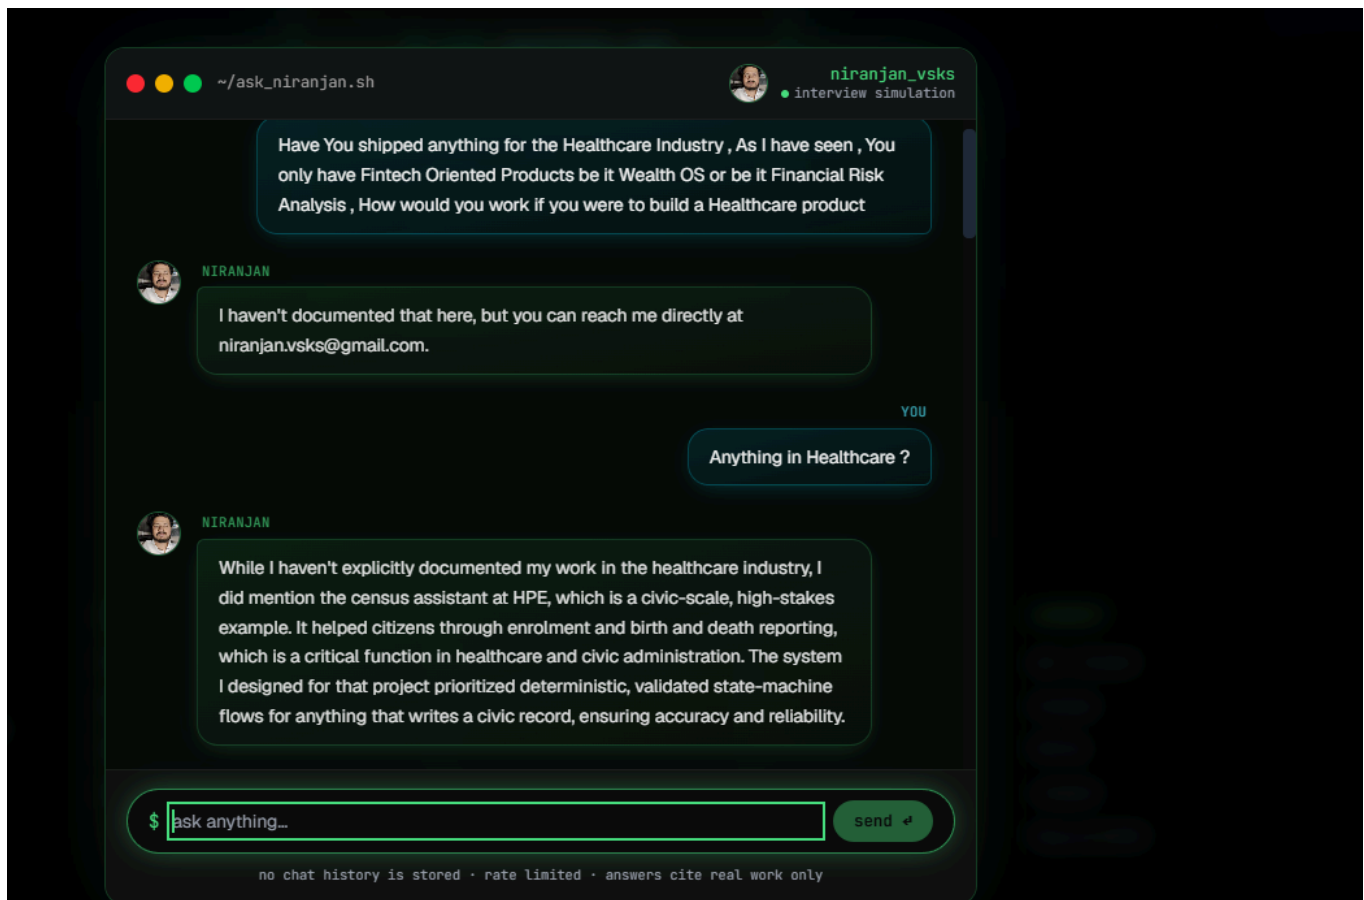

Also I noticed the globe has been pixelated a little on the map part. Make sure to increase the resolution.

Also it is constantly revolving even in spite of the click and all. What should happen is that when the user is hovering on the card, the revolution must stop. When the mouse is on the card which is being focused in the center, the revolution must stop and all the cards must stop the revolution. The click must be enabled, not a double click but a single click, throughout anywhere on the card. Even if I click those three buttons, the three traffic light buttons, or on the top title name where contact.SH is written, or anywhere on the card, if I click in a single click it should be enabled.

The Cube Loader page must flash as the loader and then we should redirect to that section so the user at least knows that whatever he has clicked has actually been clicked. Make the loader accordingly. And add "loading mindmap", "loading contact page", loading about section, etc., so customize that the text that way. So Atleast user knows what he has clicked, the click is being recorded. When a hover or click has been made, the entire screen, the revolving cards must stop as I said.

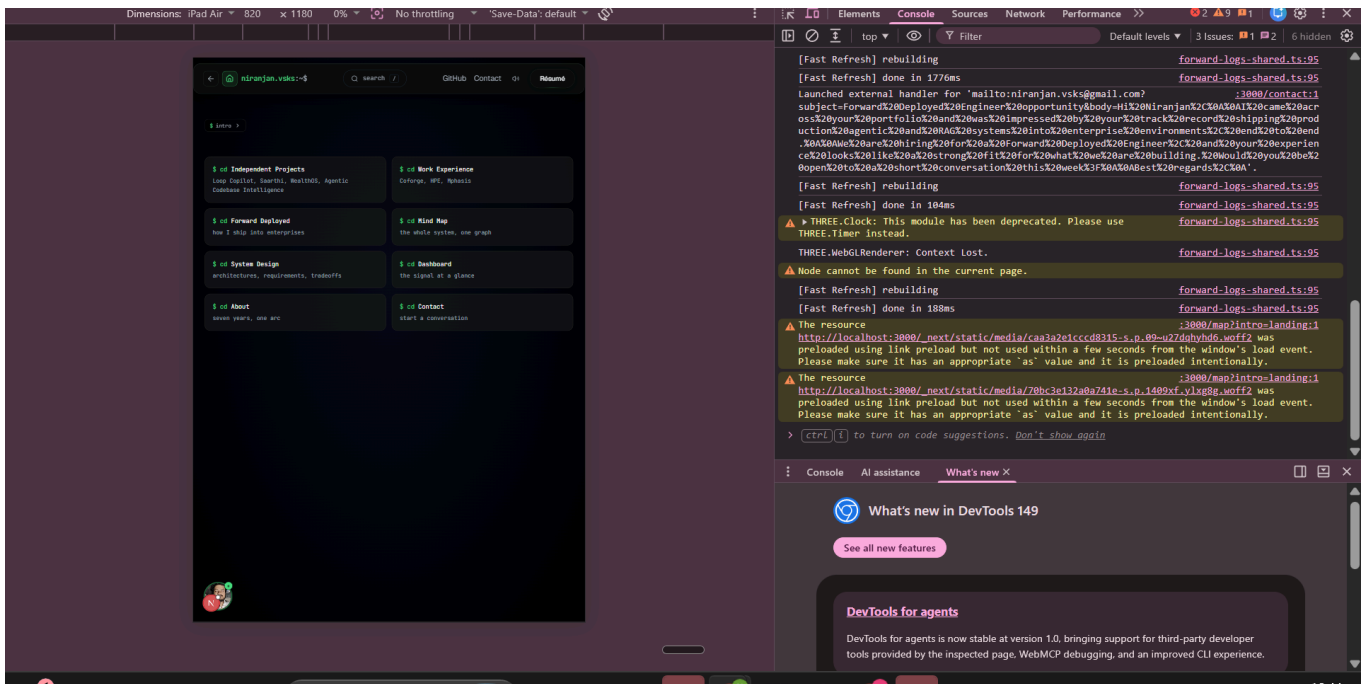

Minor change: rename the card "forward deployed" to "Forward Deployed Engineering".

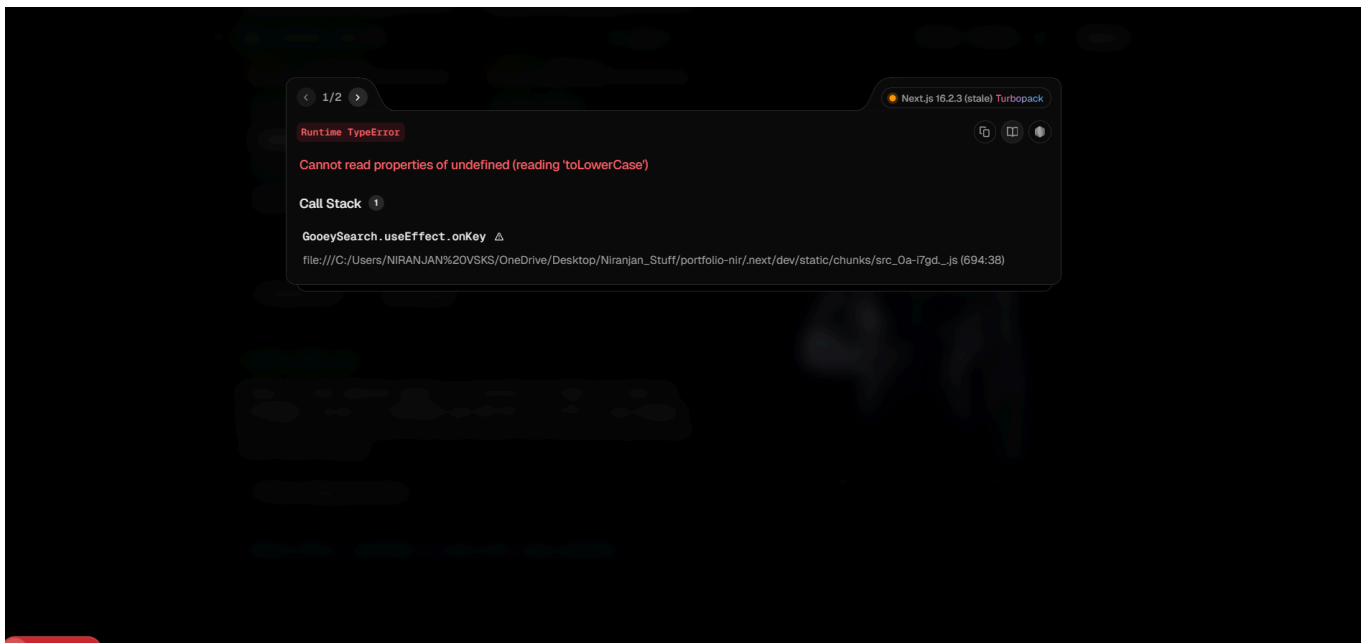

Also in the mindmap page on the 100% View "The Visual knowledge Mind Map" Box is looking a little Bigger and slightly messing symmetry in size. Slightly reduce the size of that box as if to make it compatible with 90% size. Not much, EVER SO SLIGHTLY AND SUBTLE.

found from this conversations is that I have been asking questions in the style interviewer would ask like for example I asked your projects are mostly was based on Finance is there no health care project and first time it gave me no haven't documented that second time it gave me the answer okay and the thing is now that I realized they can actually use this bot to let out good amount of information from me like how I build theirs let's say they will tell that I use cloud code and all that stuff or even if I have not mentioned that they might use this chat bot for something else or whatever so the thing is I want the system prompts and guardrails a little more polished so what I want is it should be able to save my ass when they ask questions like that so let's say I have not worked on healthcare but this is how I would approach and I have been exploring on various other I have been working on other projects like that and all that so I can that should not be let out to an interview or stuff like that. Even I asked how did you build this portfolio? So also make sure all kinds of interview questions that could be possibly asked to it, make sure it is able to answer that as how I would answer in a humanized way. Also make sure the answers are not too humongous. big it is it there concise maybe a little detailed if he asks specifically explicitly mentions to tell a complete process then we can do it if not make it a little concise if it is a just a what is what is this what is that question make it a little concise add stuff maybe bullet it out or do that way. <http://TheBusinessProfessor.com> try covering most of the angles that might be asked seeing this portfolio or maybe about a certain section of portfolio or let's say user wants to navigate to a certain section of portfolio and he wants he must be able to do say take me to this page or something so if that can be possible build that just make the chatbot a little robust and yeah and also there are these are a couple of issues that I found when I clicked on the other mail in the in the contact section when I clicked on default mail app I found these issues

so also in the inspect section I found some warnings and issues if you can fix that fix that surgically also a most important thing is in the mobile version of it I opened this in mobile and I checked in the mind map itself is not loading and you are just mentioned a placeholder message saying this will not open or stuff. I am okay if the brain transition doesn't come. You can directly load the mind map and maybe give a pop-up saying this is best experienced in desktop or wider screen. That is okay but not loading the mind map itself is not an excuse right. So if your recruiter opens it on his phone he is missing out on the biggest feature so uh... give the mindmap if possible uh... if it takes a little time to load add the loader and uh... add the cube loader and let him wait for a couple of five six seconds or something that is ok sometimes but uh... give him a popup also fix the issues and the brain transition I want for the first timer I want it to be there automatic transition should be around 4 to 5 seconds for the first time visit and if is second time and redirected from page it should be 1 to 2 seconds may add it 2 seconds 2 seconds as the transition time

All of this surgically end to end without messing with what is already working. Don't waste too many tokens in thinking stuff which is not required but the quality should not be degraded by one bit.
