

New Portfolio Fixes Now

I still I still see these fucking boxes. Told you I don't need those boxes here. The text must be on the screen and also the font is not visible and readable. I told you to increase the font size a little. Make sure it is a little readable. When you first look at it, it should look readable. People should not have to stress out their eyes to read the description of a fucking project. Don't make it so big that it looks weird. Proportionate it properly with the size of the page and make it readable.

Reference Architectures

How I would build systems like these. Pattern-level diagrams using industry-standard primitives (Docker, message queues, vector stores, graph databases, secrets managers). No proprietary names. These are reference patterns reachable from each project, framed as how I would build, not internal disclosures of any deployed system.

01 Loop Copilot

interactive · how I would build it

Event sourcing over vector RAG for chat context, and a three-tier integration shell that lives within the customer's tenant trust model. Toggle planes; hover any node for the rationale.

event sourcing

tenant trust model

async API

multi-CRM shell

control plane

observability

```

graph TD
    Client[client web + chat] --> Gateway[async API gateway]
    Gateway --> EventStore[event store]
    Gateway --> ContextAssembler[context assembler]
    Gateway --> LLM[LLM hosted]
    EventStore --> Tier1[tier 1: tenant-native flows]
    EventStore --> Tier2[tier 2: direct REST]
    EventStore --> Tier3[tier 3: session fallback]
    ContextAssembler --> Tier3
    LLM --> Telemetry[telemetry + alerts]
    Tier3 --> CRM[CRM of record]
    LogActivity[log activity] -.-> EventStore
  
```

02 Agentic Quality Engineering (reference architecture)

interactive · reference pattern

GraphRAG

agentic RAG

reranking

LLM observability

tenant-aware RAG

Here what I want you to do is these are placeholders right now. I have pasted some images in regarding the worktop architecture, that is the AI-infused quality engineering platform. Only and only the AI-infused quality engineering platform must be the reference architecture or must be said as how I would build it. Not all system design sections must be like how I would build it. Also the system design section doesn't mean only the architecture diagram.

What we can do is say how the functional requirements, non-functional requirements, and other stuff, whatever is usually asked in a system design interview about that. What I want to include in the sections is for all the projects. I want to add those sections also. Also if this image or this section is where I click on the architecture diagram, what the behavior should be is that when I click on it, it should expand and occupy the whole screen. It should maximize and show the entire architecture diagram.

For whatever we have chosen to be interactive, those elements must be interactive. There must be clickable hover actions and we must mention how we have done that and stuff. There must be a little one-line caption about, let's say, what kind of stuff we have done there. That must be there.

For the non-interactive ones the hover actions must still be there on that component. If we hover, it should give a small caption as a dialogue or something like some text hover text. That must be there. Include those sections as well.

The most important thing is the actual architecture diagram for that. I have given you the architecture diagram for worktop, which is the AI-infused quality engineering platform. Properly make it into a professional-grade architecture diagram and embed it into the portfolio. Make sure you include whatever guidelines we follow for the masking of the sensitive data that we are not supposed to show. Include everything, as I said. Just the names and only the "how I build it" narrative must be there with cohorts. All the other stuff, I repeat, all the other projects, can be shown as the actual one. You literally made the title caption of the system design section itself in the TurnWell card on the landing page as how I would build it, which is a very defensive mindset, is what I am saying.

And also for the HPE conversational RAG Project , Build and Design the Entire Architecture Diagram for that , Professional Grade and Premium Looking what data have we built production drag for? Basically it is a chat assistant which queries over the company's internal documents repository of documents, around 1,700 internal documents. It properly follows all the re-ranking and all the rag principles You can see the bullets of the resume and also the data which I mentioned. It is completely deployed and it is a dockerized deployment and all that. It is designed to handle 20,000 concurrent users . Add Load balancers and stuff and HPE had a Squidex Content management system and Confluence was also used as Data source So You can Build it like that . You have Eraser MCP Integrated , use that if needed but again Dont Let context bloat and overkill tokens , Optimize for token usage without compromising on quality.

The Census chat Assistant. It is a chat assistant to help the government of India conduct the census so there are multiple features, FAQs that the user can ask. Also it enables NPR registration (national portal registration) and people can report births and deaths through that and other stuff like that. It's centrally connected to the government's data and it can retrieve other stuff so that was also a Gen AI / conversational AI use case. There was RAG as well so you can make an architecture around that. The deployment of that one was on Azure, I guess. This one was on AWS. This global process chat assistant, I guess, was Deployed on AWS.

In the independent projects we have Loopo Pilot and Sarthi, right? I want you to build an architecture around that as well. Build me a production architecture for Loopo Pilot since you know what it is. I would definitely be scaling it up so make it a production-level architecture that would be best suited for that to handle around at least 1,000 concurrent uses to begin with. Also use all the security standards and all the keywords or whatever secret managers or whatever are needed for that kind of data, whatever data it has. Make sure it is properly integrated so we can use this.

Use an Azure deployment here because it is connected to Microsoft. It would be good to use an Azure ecosystem here. That is what I'm thinking. Make it an Azure-based architecture while you're designing that. Whatever you're designing, whatever you're making, I'll defend it in the interview. Mention a little about the architecture as well. Maybe you can create a document, create an MD file, and write about it in the screener as well. Do that.

That is one big thing which was pending so complete that right now. Prioritize the architecture first and then do the small adjustments that I asked you about, the font and other stuff. First prioritize that and then let me know once done. You can move to the minor adjustments because you are Fable 5. I need your best reasoning for the architecture diagrams and for what your capabilities are required for building those architecture diagrams and stuff like that.

Also for the HPE projects let's give some better titles. They are literally shitty titles. Give me some good titles that I can actually add so I'll update it in the resume as well.

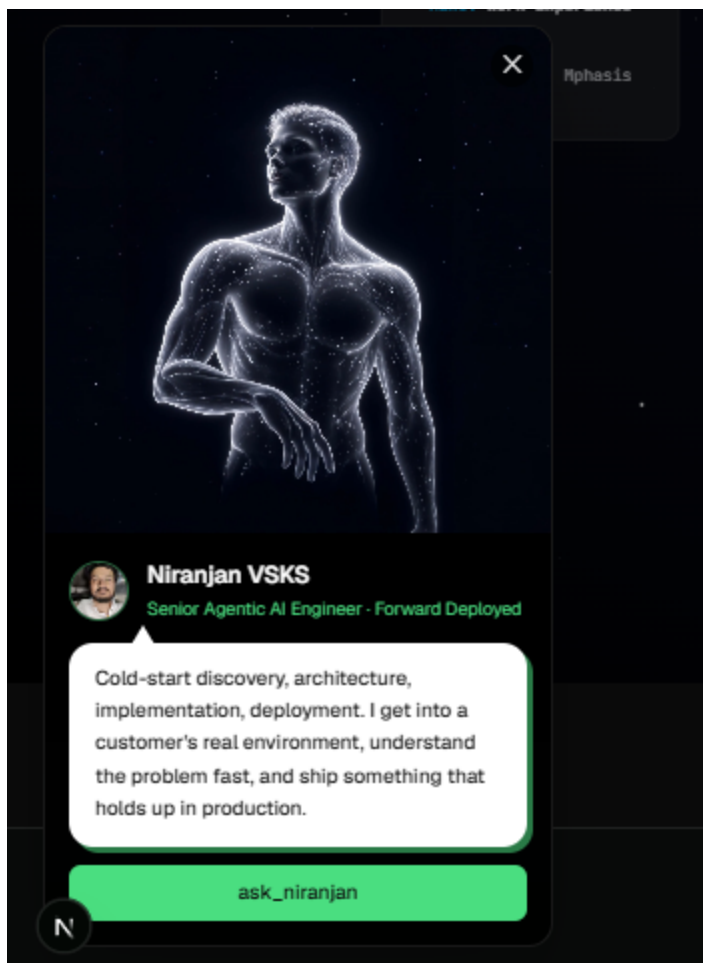

Also this Name Card :

take it like a card. Once we click on that icon directly instead of a card, that star man guy should just float in mid-air like how it is instead of just his photo. It's looking like his photo is being framed into a card. Instead he should just be there and floating in the air and he should appear like an avatar. We are trying to stimulate an avatar here so he should just be there.

About his head there should be a dialogue box as if he's saying it. We would give the summary out later. I would be adding a voiceover of it using 11 labs in V2 but right now let's do it again.

This way also by default when the user opens it for the first time, this guy will come up and the dialogue box of the summary will come up. After five seconds the dialogue box of the summary will disappear. After ten seconds the star man guy will collapse back. This icon will automatically collapse back and if the user wants to collapse it, that will happen anyway. If the user clicks anywhere else other than the dialog box or even clicks anywhere, the dialog box will disappear.

Inside the dialog box only or maybe under the legs of the guy, in front of his legs, under his avatar, maybe you can have a floating button or something on those lines with "Ask Niranjana Chat" so that guy should be there to make it that way.

Also FIX THE MINDMAP ZOOMING . WHEN THE BRAIN TRANSITIONS INTO THE MINDMAP , THAT IS WHEN THE MINDMAP LOADS IT IS LOOKING VERY SMALL AND USER HAS TO STRESS THEIR EYES AND ZOOM IN MANUALLY , INSTEAD IT SHOULD START WITH A ZOOMED IN VIEW ATLEAST TO A POINT WHERE THE NODES AND EDGES NAMES ARE READABLE .

Build this Fixes end to End Surgically and then complete remaining .
