

New Portfolio Fixes Now

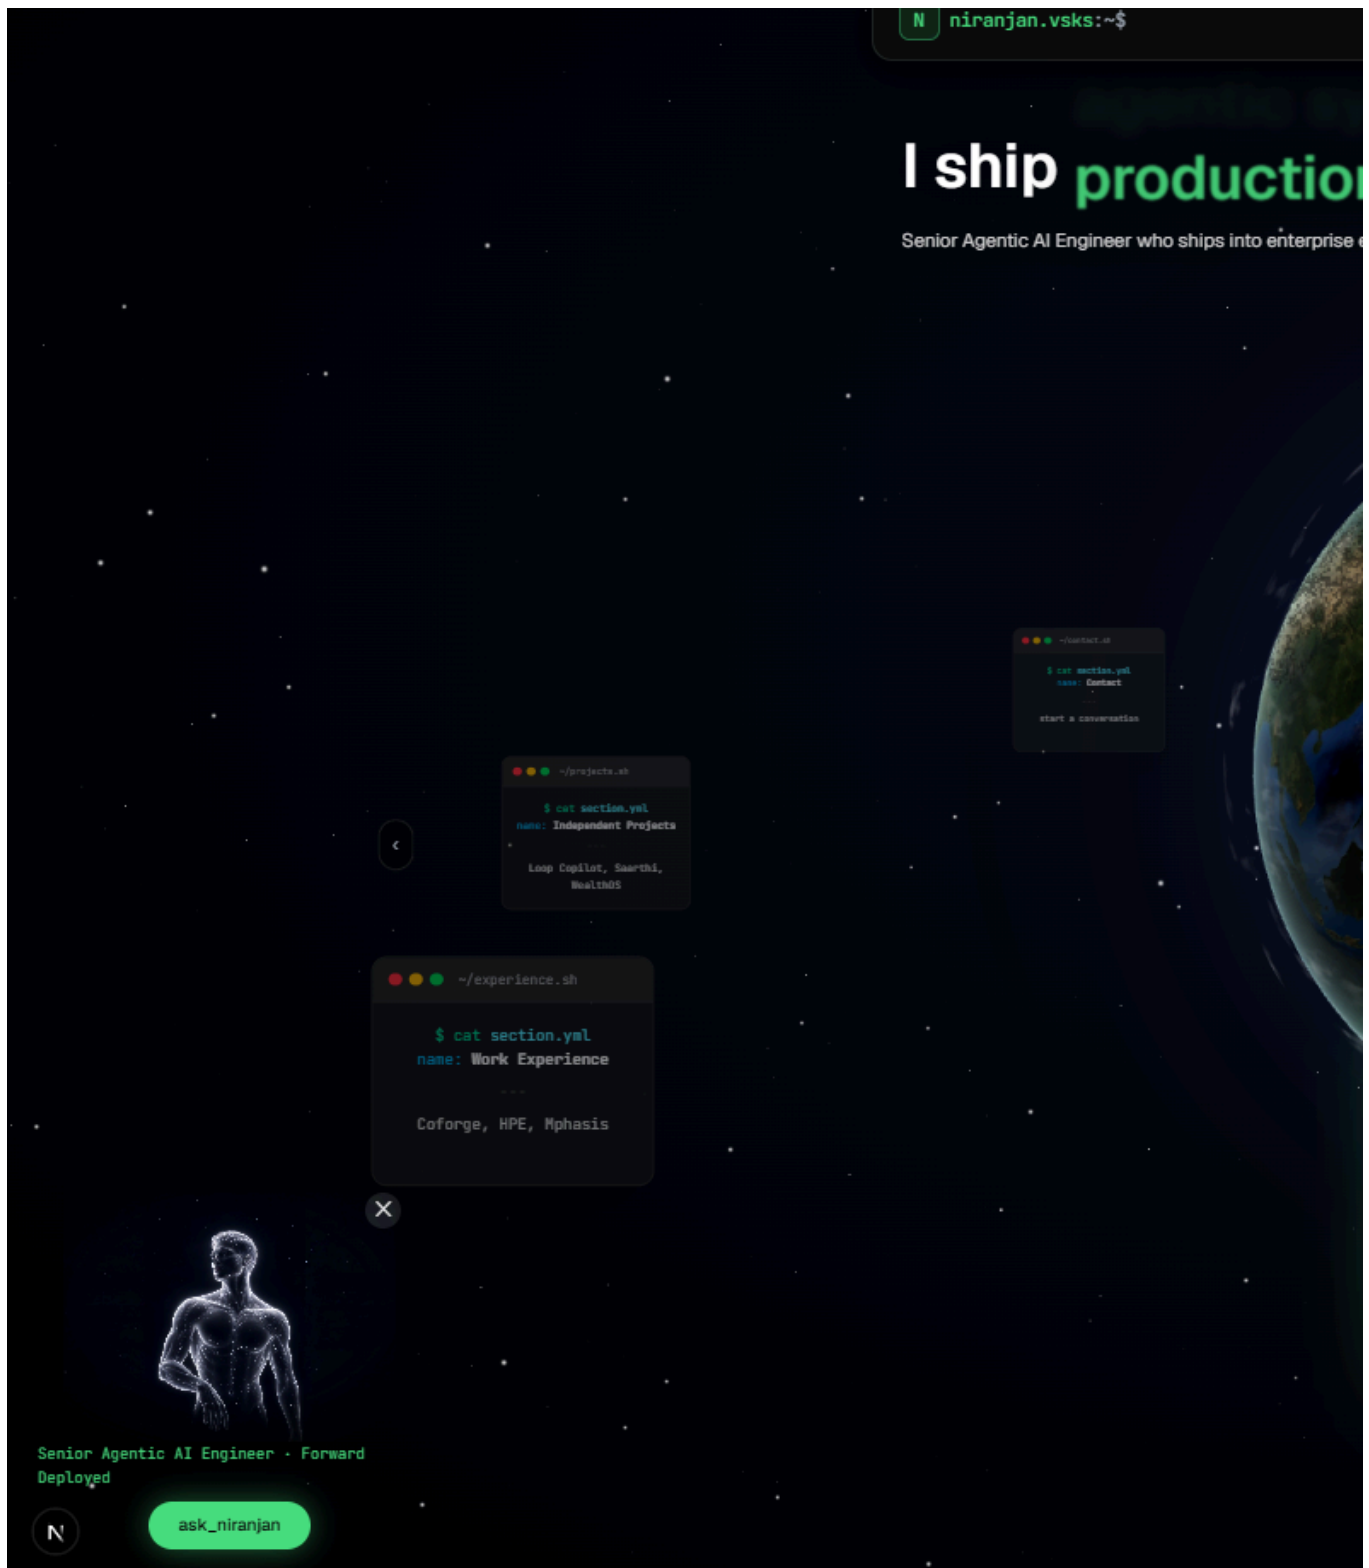

Who the fuck puts a phone inside a phone? That is the shittiest template that you've built. What I asked you was: this phone, which is floating, is madly just doing up and down, back and forth, back and forth, back and forth, flipping. You directly copied down that green screen saver template as it is.

What I meant was this iPhone would be slowly flipping, slowly rotating, and inside that iPhone would be the actual mobile view wireframes of the actual application. That was the point of mobile view, right? Why do we want to have an outer mobile background again and inside that? Are we shooting a fucking inception movie?

Also it is pretty useless. It's a waste of tokens even building that so you can increase the size of that iPhone a little. That iPhone should be floating in mid-air. That iPhone should be occupying the center stage and it is moving a little fast right now. You can make it slowly move and inside that iPhone we should have the screenshots, the wireframes of it. Plane, so that is how I want it to be.

Edit that video Accordingly and do it , I think I have remotion Module installed if not install it.

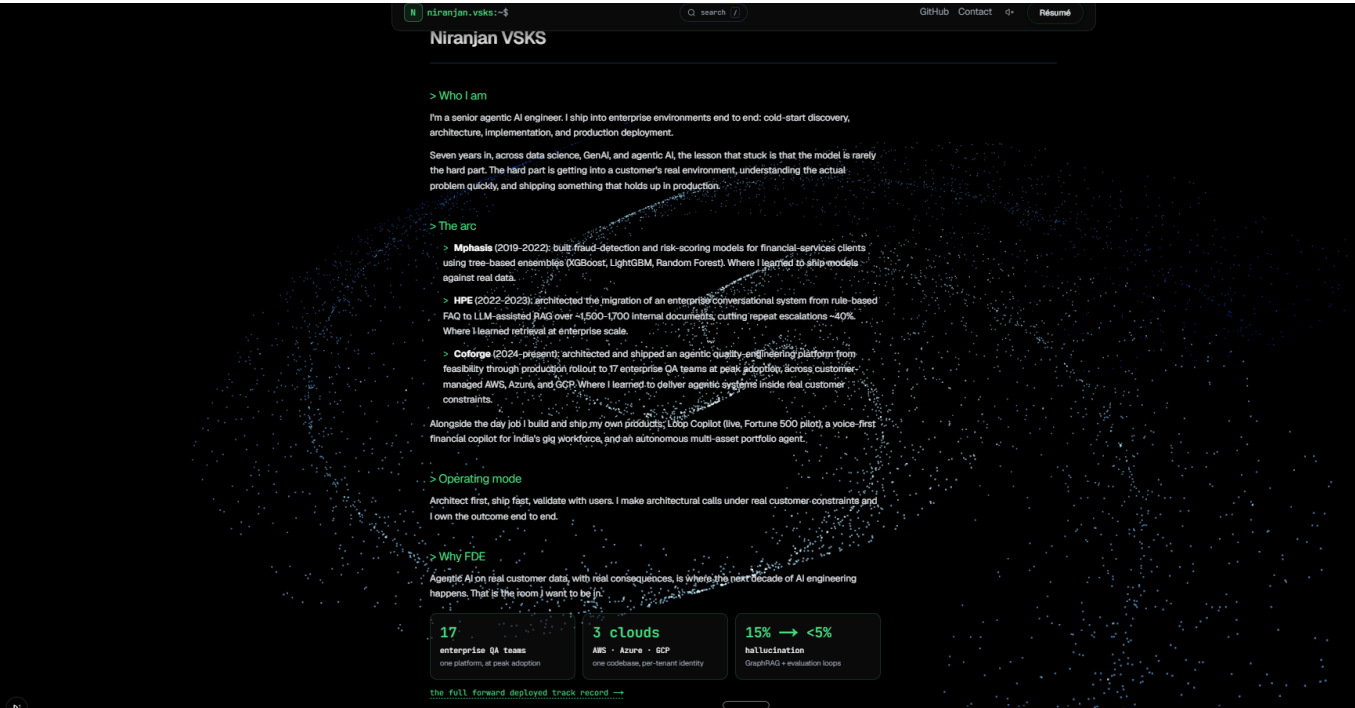

Also size of the avatar can be increased a little, not too much, but it should maybe expand it a little more. It's anyway on the left so just ever so slightly increase the size of it a little. Make it appear a little bigger.

So in the About section I clearly asked you to, even if you have to change the font styling, change it. This font size is fucking small. It is not readable. The first impression is making your eyes stress. The user has to stress a little and read it out. You can increase the font size. It will slightly change the font styling or whatever so it is a little troublesome to read.

Also in the Why FDE section, see the full FDE track record. This button hyperlink is not clearly visible. Maybe add it to the right side or maybe put it as a button and increase the font size a

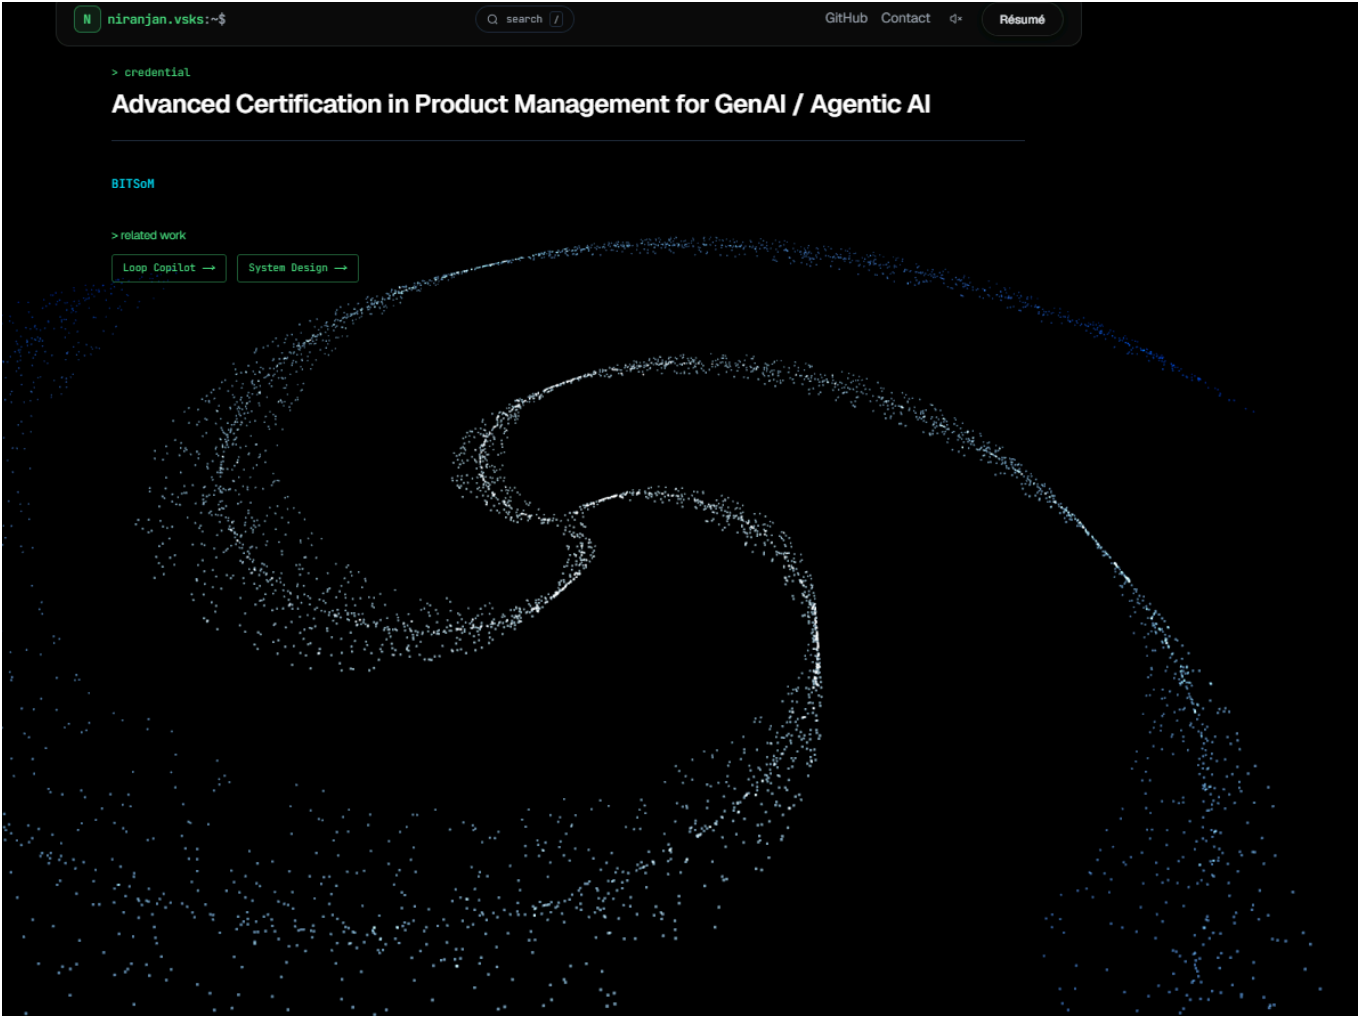

little. Change the styling if you have to but make it readable please.
And Make it Deployed Across 3 Cloud Service Providers

Also For the Certifications , What is the point of Creating a dedicated page if it is Empty :

I am giving you some context of what the program includes from their main site, Frame up a professional Description of what I gained from it and what value I provide with the product understanding . This table i sent from their website is for YOU to understand and get context , dont mention all those placement stuff and the replit , lovable usage, We Actually used Claude Code but dont even mention that , we converted them into full fledged apps and not just MVPs . Also Voice First Financial Copilot was the one under this related work , Not Loop Copilot . But I dont mind it if you Add it Under that related works . But I also Told you to add a Product Section to the Projects right , For Saarthi , I uploaded the PRD , in the Saarthi folder Take all the knowledge from there . Also There it is mentioned as MVP but we upgraded it to a full fledged pilot ready Production app. So Play it as that and only derive the Product knowledge we need like Success metrics , maybe SWOT , MosCow , JTBD , value proposition , etc , Dont over clutter with too much data so it overshadows the FDE part because the Portfolio is of a FDE not a PM . But it should have good amount of data that it deserves a dedicated page of itself , so keep that balance. You can use Terminal Style cards here again , Like a Card for JTBD , A card for MosCow and RICE maybe , A card for Success Metrics , etc. And for the other Projects till your best knowledge and Reasoning write that up based on the data you have about that project (Product section Not Required for HPE and Mphasis Projects) Only AI Infused QE platform , Loop Copilot , Saarthi .
So Build that .
Also I attached the actual certificate file in the Saarthi folder. Upload that certificate image as well in the Page of the Certification.

For Claude Certified Architect , Give a Professionally acceptable Description saying that I registered for the Exam and once I complete the certification it will be uploaded.

Features

Combined Academic and Industry Mentorship

Build AI-Driven Products

Student-Centric Approach

Industry-Recognized Certification

Placement Opportunities

Project-Based Learning

This Programme

Learn from BITSoM faculty and industry experts, blending cutting-edge knowledge with real-world insights in Generative and Agentic AI.

Build real AI products using 10+ industry-leading tools (e.g., Replit, Cursor AI, Lovable) to tackle real business challenges.

Receive personalized feedback, access to a vibrant peer community, and one-on-one mentorship to ensure a transformative learning experience.

Earn a certification from BITSoM, recognized by leading AI-driven companies.

Assured interview support and expert coaching to maximize job placement chances. (Eligibility: 7+ CGPA and 65% attendance)

Gain hands-on experience by building and deploying six AI-driven products, supported by real case studies.

Also in project sections :

These Tags have to be Clickable and should Redirect to the Mindmap and zoomed in to that node of it , that is still not fixed. for example I click Solutions Architecture , It should go to Mindmap page , the Solution Architect Node should be zoomed on and the first thing to be shown , also the Brain transition must be shown only for the first time that the user is logging

into the mindmap page. After that the subsequent logins need not show the brain transition. Every time it shows, he can directly load the mindmap and it should zoom into the exact node that is being clicked. Ok? If the user manually goes back to mindmap again, even from the home screen, for the subsequent times until the browser cache is refreshed, we don't need to show the brain transition again and again. Or lets do it like this , If user has Clicked on MindMap Card On the Landing Page , then we show the brain transition and For Subsequent navigations from the landing page after the first navigation we reduce the automatic burst effect time , so right now I guess the animation effect takes place after four or five seconds. In the subsequent navigations from the home landing page we do it immediately after one second or so. If you are redirecting to the mind map from these clickable keywords, no brain transition will be shown. Any navigation to the mind map section apart from the home landing page globe terminal card click, no brain transition is shown for the subsequent navigation.

Let's say the user has not clicked on mind map ever in his workflow, in his flow path, and the first ever time he is navigating to the mind section is from the keywords. In that case we will show the brain transition with the five-second transition only. Keep it as four seconds, that is, the four-second transition only, the four-second automatic transition. When he clicks it should transition, okay, that is already there.

That is what I want to integrate and it is still showing very small when it is loaded. Please zoom in. The default loading of the mind map should be a little zoomed view. That is what I am asking. Why are you not able to deliver that?

Also that font style styling change to make it readable, which I asked for the about section. It is not just for the about section. It is for the projects section and maintain that consistent styling throughout wherever it is. Even the product sections .

ARCHITECTURE DIAGRAMS :

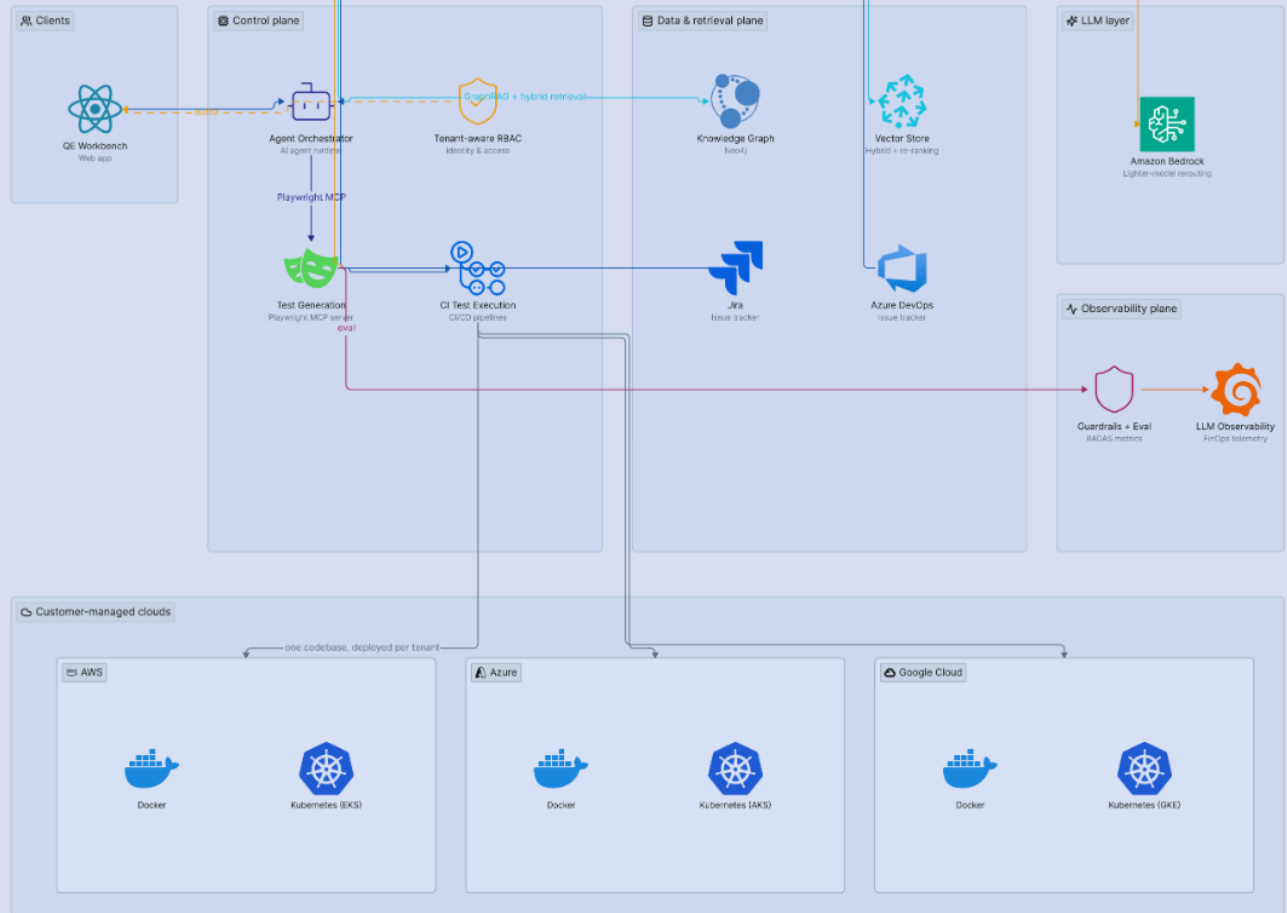

also regarding the architecture diagrams, there are some basic flaws here. The arrows are extending out and overlapping with each other and it is very waywardly looking. I want you to first fix that and also refine it to look a little more professional grade and premium.

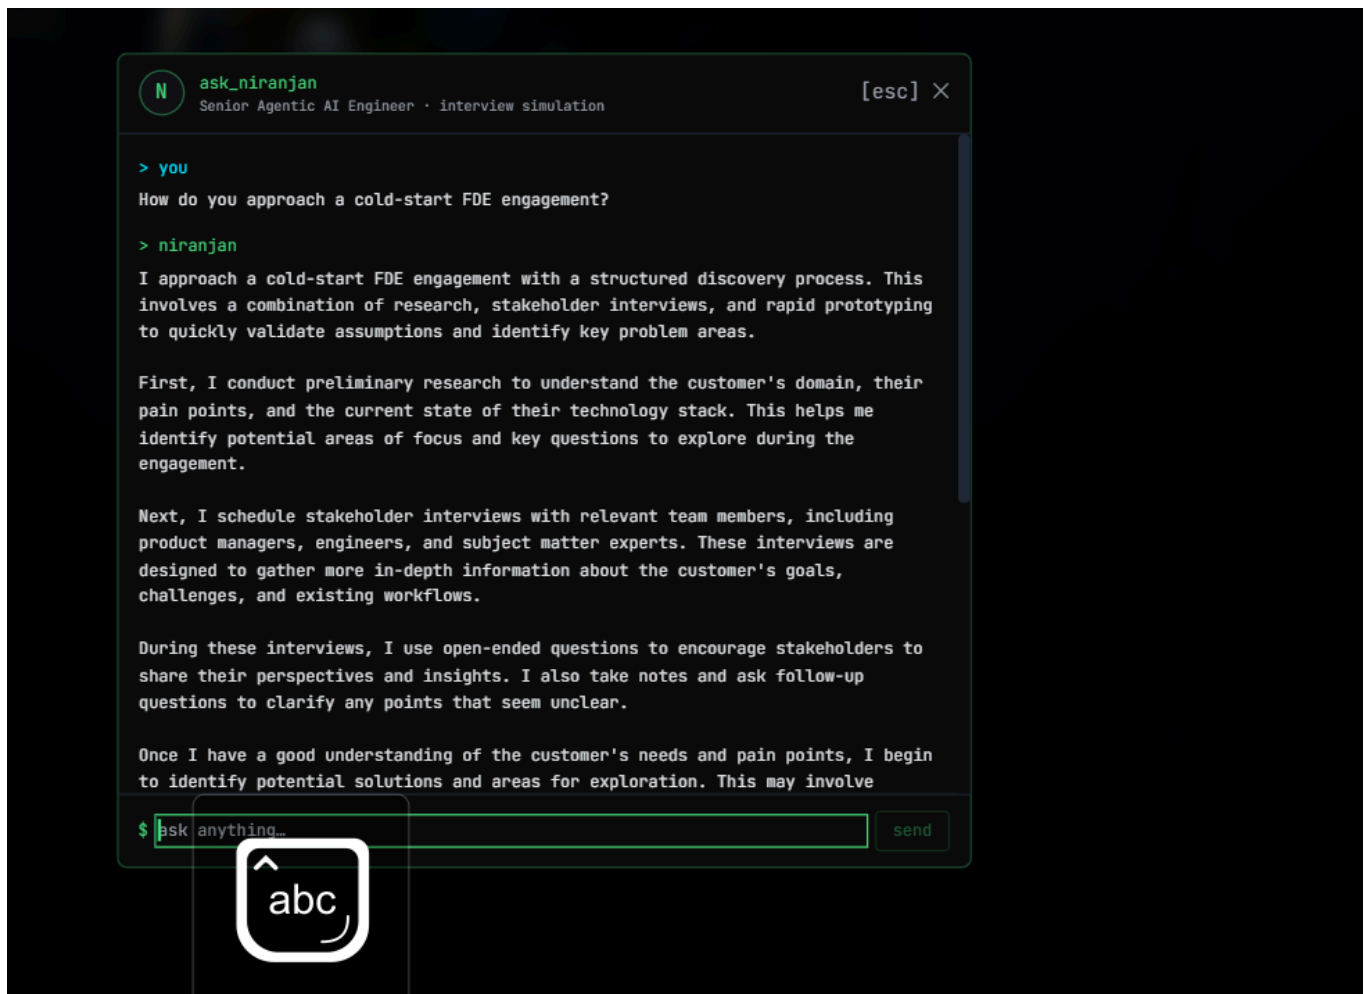

I actually expected a dark theme but right now keep it as a light theme only. Don't stress too much on it. I will fix it later but right now we need to get it ready at least so do it that way. At least fix this, make it look more professional, and refine the quality a little more.

Also I want there is another placeholder reference architecture that I see. Please fix that. Also I clearly mentioned that the reference architecture and how I would build it is only and only and only for the AI-infused agent tech QE platform. For all of them you can actually say that this was the actual architecture by the way. That is not the problem at all. Even for the HPE I don't mind if you use the "how I would build" narrative but other than that I am definitely okay with "for loop copilot" and Sarthi. I would actually in fact want you to use "this was the actual architecture built tone". I mean that notation is okay for me.

AI-Infused Agentic QE Platform

Reference architecture — left-to-right request flow

Coming to the chat bot, it is looking very plain and bland. I want you to style the chatbot a little better to make it look like a good chat assistant. Maybe if you can make some conversational dialogue boxes or something, I don't know. Make it look a little premium and better. Kind of not looking the best now is what I would say.

> infrastructure optimization

TODO(niranjan) : Same rule. Requires real deployment + real load before this is honest content. Once deployed:

- > Document actual hosting tier and cost.
- > Document any scaling decision made in response to a real bottleneck (not a hypothetical one).
- > Report actual latency numbers (STT round-trip, LLM response, TTS synthesis) under real conditions.

> forward deployed engineer framing (reference architecture, not a claim of deployment)

This section is legitimate to publish now because it is framed as "how I would build this at enterprise scale," not as a fact about what has already happened. Use "reference architecture" / "how I would build" language throughout, consistent with the liability firewall.

- > **Cold-start discovery approach:** **TODO(niranjan)** - your actual discovery process for Saarthi (user interviews, sample size, how you validated the trust-first reframe before building).
- > **Deployment topology (reference):** Voice input -> STT -> orchestrator -> sub-agent routing -> curated RAG retrieval -> guardrail layer -> Gemini -> TTS -> response. Describe as the pattern you would deploy into a customer environment, not as a live system.
- > **Multi-tenant / scale considerations (reference):** How this architecture would need to change to serve enterprise-scale gig platforms (a logistics company's driver base, for example) rather than a 15-user pilot. Write this as forward-looking judgment, clearly labeled as such.

So why the fuck are you mentioning Todo Niranjan in the actual website? If you want to tell me that there is anything pending from me, create another separate markdown and tell me what all I need to do. Why are you presenting it out there? We need to fucking deploy this right. It should be end-to-end presentable. We are trying our best to create a presentable version so that we can deploy it on our domain. Tup send placeholders and Todo tags and all that in production. That is absolutely unacceptable.

SURGICALLY IMPLEMENT ALL OF THIS END TO END AND COMPLETE ANY REMAINING PHASES AS WELL AND WE CAN GET ONE VERSION READY FOR PRODUCTION.
